Site Access Systems

CMS's site access system match Hardware Turn-style Systems with the existing CMS Hub cloud based attendance system and app based OnSite Selfie clock-in system. Currently under development for release end of Q1 2023.

Designed to meet specific client requests, CMS APPs are constantly improved and updated to provide increased functionality to meet the ever changing site requirements.

Either integrated as part of CMS Procure or CMS Selfie, they are also provided as standalone tools. Centralized within the CMS Hub interface all tools share similar admin and integration.

Standard Hardware

Site Device Enforcement

Cloud Based Administration

Cloud Based Attendance Panel
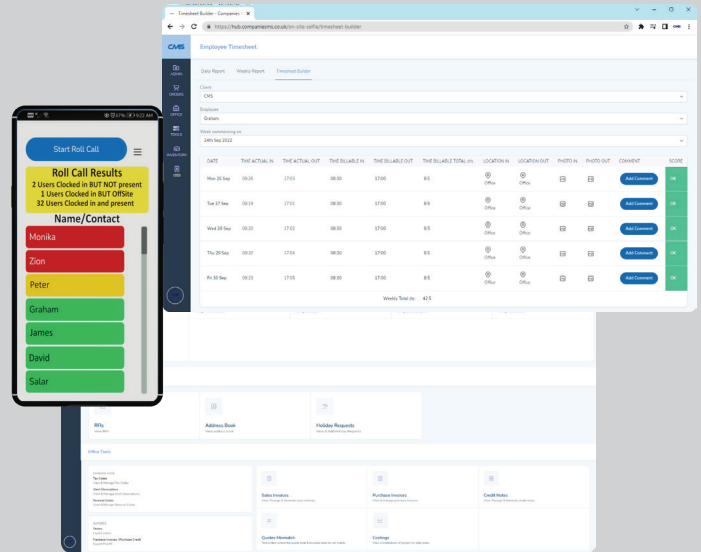

Sub-Contractor Guest Management

Compatible with Entry Sensors

Customisable Access Systems

Working together within the CMS Hub and OnSite Selfie attendance system

- Standard Turn-style Hardware
- Multi Level Site Access
- CMS App integrated
- Cloud based Site Attendance Board
- Site EVAC system
- Interface for Alarm System
- Time Authorized Access
- Sub Contractor Guest System
- Standalone Self Powered Systems
- Compatible with Temperature, Face Recognition and other standard access sensors.

OnSite Access

Utilizing the existing OnSite Selfie app, operatives clock-in to a project and are geolocated as at the site. If they are assigned to have access rights to an assigned site access point the operators app will be assigned a token to use the access point within the tokens life period. Token life is set by the client.

The operators device is then used as the access key to use the site access device such as a turnstile. All activities are then logged for all exit or entries taken with restrictions set for one exit required for each entrance.

If token life expires the operative can request a new access token without having to clock-in again.

Site attendance board and site restrictions

As the CMS access system utilises the cloud based CMS hub back end, items such as Site Attendance, use of Site Access Points or restricted areas is available to any authorized cloud connected device.

In addition, as the operators device is utilised as the reporting system site gates can also provide temperature check systems or facial recognition as secondary checks. Each reporting back to the app and CMS Hub on why entry was denied or accepted.

Sub-contractor Guest Entry

Site Managers can be given permissions to allow Guest Entry to certain parts of the site.

Using the CMS App a guests entry details are entered into the app by the manager who will be responsible for the guest. The Manager then has to be present at the entry point with his device to allow entry.

Once guests are on site the responsible manager must again be present with their device to allow controlled exit.

Exit and Entry can be provided by any authorised contractors.

Site Muster Roll Call / Evac

Integrated with CMS Hub through the site attendance app On-Site Selfie. This application allows any authorized Manager to start and take a roll call for his designated staff.

Only those clocked in on site will be included and lists are created automatically. Operatives that are clocked in but have provided off-site events will be highlighted as such.

Contact details are provided instantly for any selected non present person.

Manual site lists can be exported.
